

# Summary

This document presents a comprehensive risk assessment for our GSM web application development project. Given the extremely tight timeline (approximately two weeks) and comprehensive scope, this project faces significant risks that require active management throughout the development lifecycle.

The assessment follows a phased approach, tracking risks from initial identification through development to final delivery. Each risk is evaluated based on its Likelihood (L) and Impact (I) on project objectives (Scope, Schedule, Quality, Budget), resulting in a Risk Score ( $L \times I$ ). Risks are categorized as High, Medium, or Low priority.

Three key risk snapshots are provided:

1. Initial Risk Assessment (Project Kick-off)
2. Mid-Development Risk Assessment (Week 1 Complete)
3. Final Risk Assessment (Pre-Delivery)

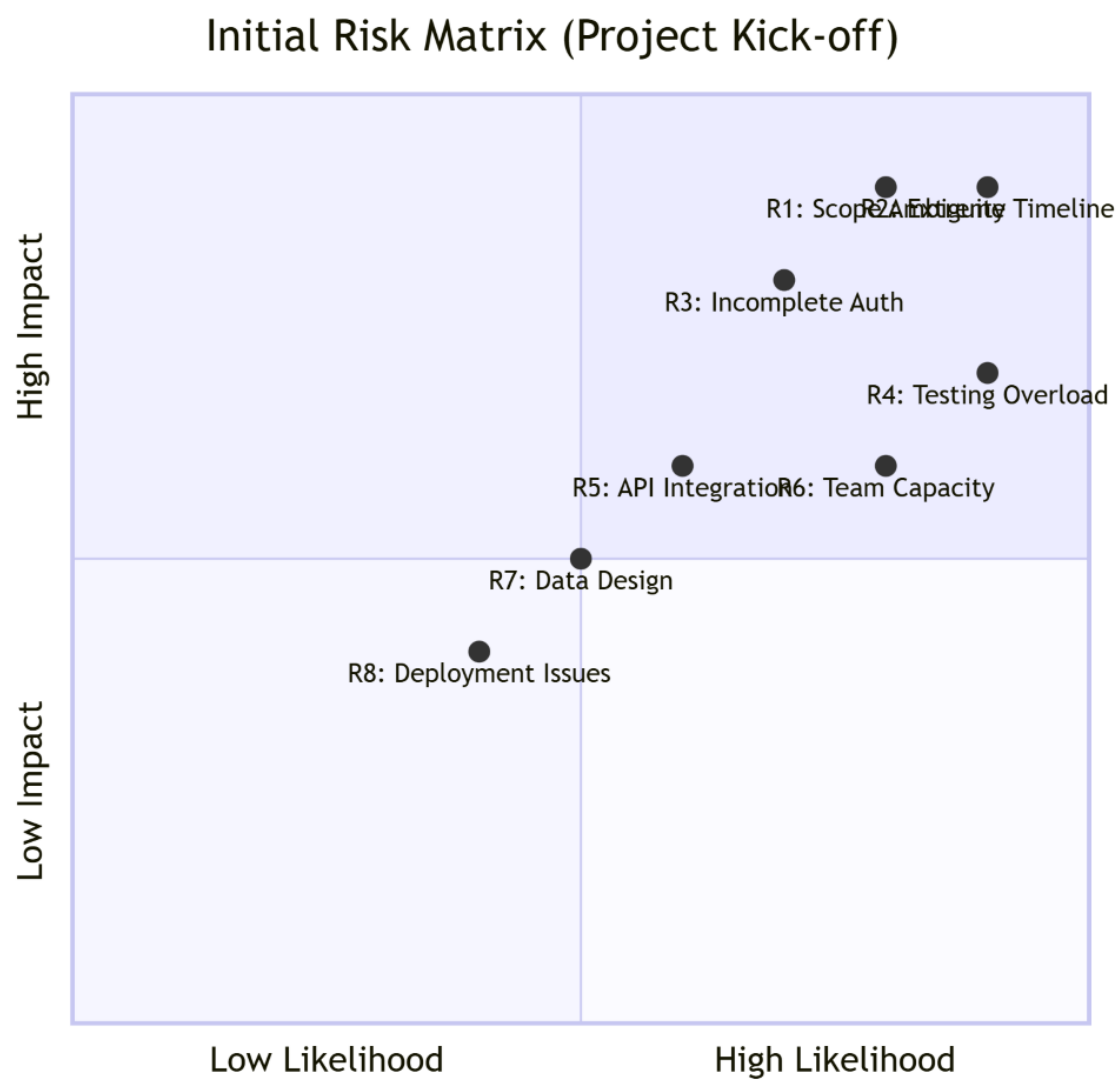

This assessment includes corresponding Risk Matrices for each phase and detailed risk tables with proposed mitigation strategies.

## Risk Matrices by Project Phase

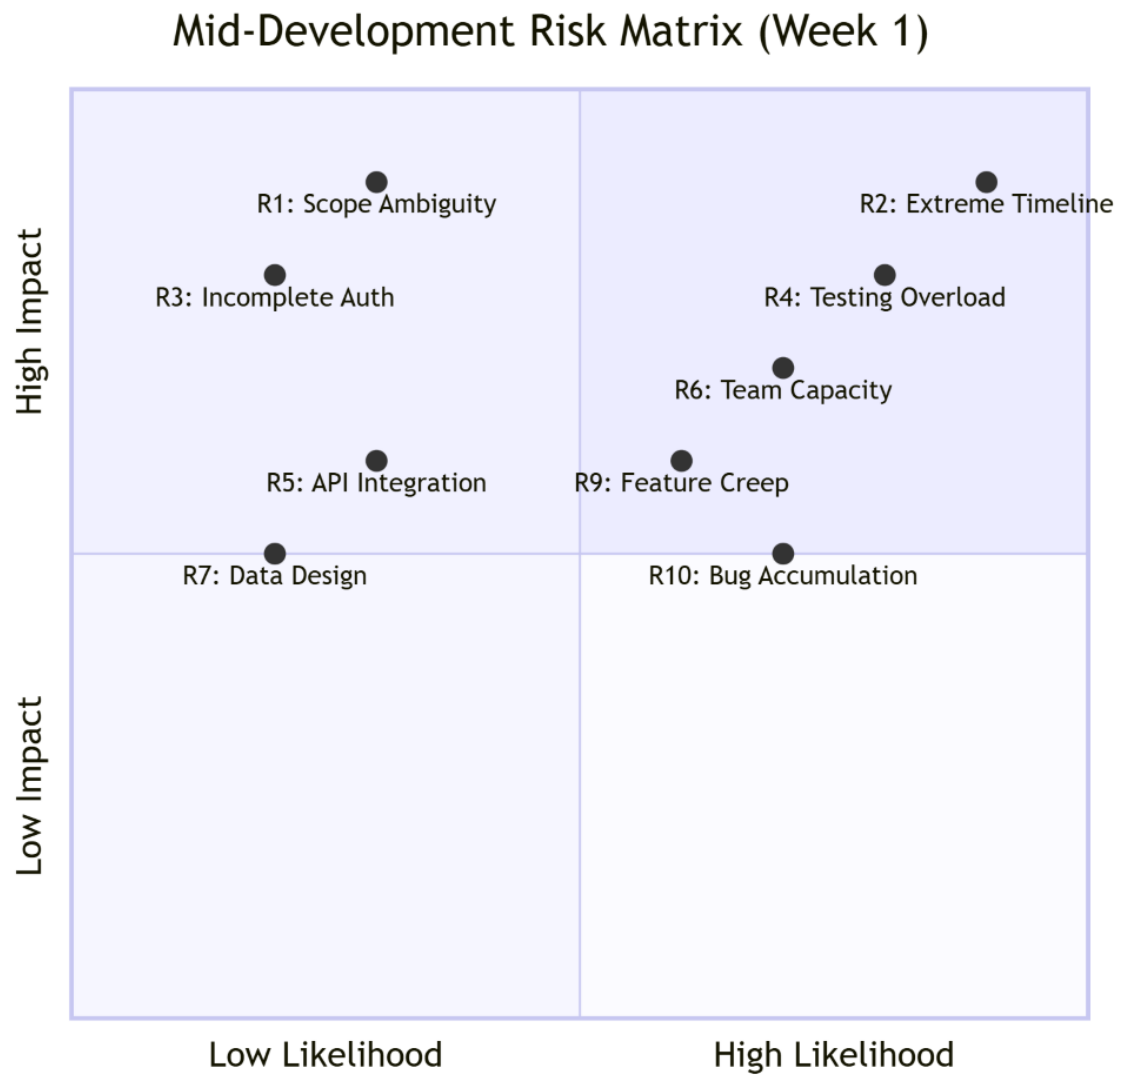

Risk Priority Legend:

- Red (High): Score 15-25 | Immediate action required
- Yellow (Medium): Score 5-12 | Monitor and plan mitigation
- Green (Low): Score 1-4 | Accept and monitor

Initial Risk Matrix (Project Kick-off)

## 2.2 Mid-Development Risk Matrix (Week 1 Complete)

2.3 Final Risk Matrix (Pre-Delivery)
